Trust Ranking

Deprivation does not explain A&E performance. Across 139 NHS trusts there is no meaningful relationship between local deprivation and average 4-hour performance (Spearman's $\rho = -0.02$, $p = 0.82$). The two lowest-performing trusts, East Cheshire and Shrewsbury & Telford, sit in areas with average or below-average deprivation. Operational factors may explain the gaps but were not tested here. Limitation: trusts are matched to the local authority of their headquarters postcode, a rough proxy for the population they serve.
